

## Solutions to Problem Sheet 5

1. A toothpaste company can make two kinds of toothpaste:

- 'Sure Smiles': a budget toothpaste that makes a profit of £1000 a tonne, and
- 'Wicked Whites': a premium toothpaste that makes of profit of £8000 a tonne.

Two of the ingredients need to be imported and so their daily use is limited: only 12 kilograms of Calcium Carbonate can be used each day, and only 24 kilograms of Sodium Fluoride can be used each day.

- Each tonne of 'Sure Smiles' requires 3 kilograms of Sodium Fluoride and 1 kilogram of Calcium Carbonate.
- Each tonne of 'Wicked Whites' requires 1 kilogram of Sodium Fluoride and 2 kilograms of Calcium Carbonate.

Additionally, to ensure that there is enough budget toothpaste available to the population, the government has legislated that the company cannot produce more than 2 tonnes more of premium toothpaste than the budget toothpaste each day.

- Using the graphical method, how many tonnes of each toothpaste should the company produce each day to maximise their daily profit?
- If the government now legislates that the company can only make £1600 per tonne of 'Wicked Whites', how many tonnes of each toothpaste should the company produce each day to maximise their daily profit now?

**Solution 1** Let  $S$  be the number of tonnes of 'Sure Smiles' and  $W$  be the number of tonnes of 'Wicked Whites'. Then:

Maximise:

$$800W + 100S$$

subject to

$$W + 3S \leq 24$$

$$2W + S \leq 12$$

$$B \leq A + 2$$

$$W, S \geq 0$$

**Solution 1 (continuing from p. 1)** *This is drawn as:*

(a) When the objective is £8000  $W$  + £1000  $S$ :

| Point                          | Objective = 8000 $W$ + 1000 $S$ |
|--------------------------------|---------------------------------|
| (0, 0)                         | 0                               |
| (0, 2)                         | 16,000                          |
| (8, 0)                         | 8,000                           |
| $(\frac{8}{3}, \frac{14}{3})$  | 40,000                          |
| $(\frac{36}{5}, \frac{12}{5})$ | 26,400                          |

So  $W = \frac{14}{3}$  and  $S = \frac{8}{3}$ .

(b) When the objective is £1600  $W$  + £1000  $S$ :

| Point                          | Objective = 1600 $W$ + 1000 $S$ |
|--------------------------------|---------------------------------|
| (0, 0)                         | 0                               |
| (0, 2)                         | 3,200                           |
| (8, 0)                         | 8,000                           |
| $(\frac{8}{3}, \frac{14}{3})$  | 10,133.33                       |
| $(\frac{36}{5}, \frac{12}{5})$ | 11,040                          |

So  $W = \frac{12}{5}$  and  $S = \frac{36}{5}$ .

2. Use the Simplex method to solve the following Linear programming problem:

Maximise:

$$3x_1 + 5x_2$$

subject to

$$-5x_1 + 17x_2 \leq 425$$

$$5x_1 + 4x_2 \leq 205$$

$$x_1, x_2 \geq 0$$

**Solution 2** Setting up the initial Simplex tableau:

|     | $x_1$ | $x_2$ | $s_1$ | $s_2$ |
|-----|-------|-------|-------|-------|
| 425 | -5    | 17    | 1     | 0     |
| 205 | 5     | 4     | 0     | 1     |
| 0   | -3    | -5    | 0     | 0     |

Choosing 17 as the pivot, we perform  $\bar{r}_1 = \frac{1}{17}r_1$ ,  $r_2 = r_2 - 4\bar{r}_1$ , and  $r_3 = r_3 + 5\bar{r}_1$ :

|     | $x_1$            | $x_2$ | $s_1$           | $s_2$ |
|-----|------------------|-------|-----------------|-------|
| 25  | $-\frac{5}{17}$  | 1     | $\frac{1}{17}$  | 0     |
| 105 | $\frac{105}{17}$ | 0     | $-\frac{4}{17}$ | 1     |
| 125 | $-\frac{76}{17}$ | 0     | $\frac{5}{17}$  | 0     |

Choosing  $\frac{105}{17}$  as the pivot, we perform  $\bar{r}_2 = \frac{17}{105}r_2$ ,  $r_1 = r_1 + \frac{5}{17}\bar{r}_2$ , and  $r_3 = r_3 + \frac{76}{17}\bar{r}_2$ :

|     | $x_1$ | $x_2$ | $s_1$            | $s_2$            |
|-----|-------|-------|------------------|------------------|
| 30  | 0     | 1     | $\frac{1}{21}$   | $\frac{1}{21}$   |
| 17  | 1     | 0     | $-\frac{4}{105}$ | $\frac{17}{105}$ |
| 201 | 0     | 0     | $\frac{13}{105}$ | $\frac{76}{105}$ |

Giving a solution of  $x_1 = 17$ ,  $x_2 = 30$ , and a maximum objective value of  $3x_1 + 5x_2 = 201$ .

3. Consider the following linear programming problem:

Maximise:

$$3x_1 + x_2 + 3x_3$$

subject to

$$x_1 - x_2 + 4x_3 \leq 17$$

$$2x_1 + x_3 \leq 6$$

$$2x_2 + 3x_3 \leq 14$$

$$x_1, x_2, x_3 \geq 0$$

(a) Use the Simplex method to find one optimal solution.

(b) Pivot one more time to find all optimal solutions.

Give your answer in the form  $\{(1-t)\underline{a} + t\underline{b} \text{ for all } t \in [0, 1]\}$ .

(c) If we fix  $x_3 = 1$ , find the values that  $x_1$  and  $x_2$  must take for the solution to remain optimal.

**Solution 3** We have:

(a) Setting up the initial Simplex tableau:

|    | $x_1$ | $x_2$ | $x_3$ | $s_1$ | $s_2$ | $s_3$ |
|----|-------|-------|-------|-------|-------|-------|
| 17 | 1     | -1    | 4     | 1     | 0     | 0     |
| 6  | (2)   | 0     | 1     | 0     | 1     | 0     |
| 14 | 0     | 2     | 3     | 0     | 0     | 1     |
| 0  | -3    | -1    | -3    | 0     | 0     | 0     |

Choosing 2 as the pivot, we perform  $\bar{r}_2 = \frac{1}{2}r_2$ ,  $r_1 = r_1 - \bar{r}_2$ ,  $r_3 = r_3$ , and  $r_4 = r_4 + 3\bar{r}_2$ :

|    | $x_1$ | $x_2$ | $x_3$             | $s_1$ | $s_2$          | $s_3$ |
|----|-------|-------|-------------------|-------|----------------|-------|
| 14 | 0     | -1    | ( $\frac{7}{2}$ ) | 1     | $-\frac{1}{2}$ | 0     |
| 3  | 1     | 0     | $\frac{1}{2}$     | 0     | $\frac{1}{2}$  | 0     |
| 14 | 0     | 2     | 3                 | 0     | 0              | 1     |
| 9  | 0     | -1    | $-\frac{3}{2}$    | 0     | $\frac{3}{2}$  | 0     |

Choosing  $\frac{7}{2}$  as the pivot, we perform  $\bar{r}_1 = \frac{2}{7}r_1$ ,  $r_2 = r_2 - \frac{1}{2}\bar{r}_1$ ,  $r_3 = r_3 - 3\bar{r}_1$ , and  $r_4 = r_4 + \frac{3}{2}\bar{r}_1$ :

|    | $x_1$ | $x_2$              | $x_3$ | $s_1$          | $s_2$          | $s_3$ |
|----|-------|--------------------|-------|----------------|----------------|-------|
| 4  | 0     | $-\frac{2}{7}$     | 1     | $\frac{2}{7}$  | $-\frac{1}{7}$ | 0     |
| 1  | 1     | $\frac{1}{7}$      | 0     | $-\frac{1}{7}$ | $\frac{4}{7}$  | 0     |
| 2  | 0     | ( $\frac{20}{7}$ ) | 0     | $-\frac{6}{7}$ | $-\frac{3}{7}$ | 1     |
| 15 | 0     | $-\frac{10}{7}$    | 0     | $\frac{3}{7}$  | $\frac{9}{7}$  | 0     |

Choosing  $\frac{20}{7}$  as the pivot, we perform  $\bar{r}_3 = \frac{7}{20}r_3$ ,  $r_1 = r_1 - \frac{1}{10}\bar{r}_3$ ,  $r_2 = r_2 - \frac{1}{20}\bar{r}_3$ , and  $r_4 = r_4 + \frac{1}{2}\bar{r}_3$ :

|                | $x_1$ | $x_2$ | $x_3$ | $s_1$           | $s_2$            | $s_3$           |
|----------------|-------|-------|-------|-----------------|------------------|-----------------|
| $\frac{21}{5}$ | 0     | 0     | 1     | $\frac{1}{5}$   | $-\frac{13}{70}$ | $\frac{1}{10}$  |
| $\frac{9}{10}$ | 1     | 0     | 0     | $-\frac{1}{10}$ | $\frac{11}{20}$  | $-\frac{1}{20}$ |
| $\frac{7}{10}$ | 0     | 1     | 0     | $-\frac{3}{10}$ | $-\frac{3}{20}$  | $-\frac{7}{20}$ |
| 16             | 0     | 0     | 0     | 0               | $\frac{15}{14}$  | $\frac{1}{2}$   |

And so an optimal solution is  $x_1 = \frac{9}{10}$ ,  $x_2 = \frac{7}{10}$ , and  $x_3 = \frac{21}{5}$ , giving an objective function value of 16.

(b) As there is a non-basic variable with a zero in the objective row ( $s_1$ ), we pivot one more time on  $\frac{1}{5}$ . Choosing  $\bar{r}_1 = 5r_1$ ,  $r_2 = r_2 + \frac{1}{2}r_1$ ,  $r_3 = r_3 + \frac{3}{2}r_1$ , and  $r_4 = r_4$ :

|    | $x_1$ | $x_2$ | $x_3$         | $s_1$ | $s_2$            | $s_3$          |
|----|-------|-------|---------------|-------|------------------|----------------|
| 21 | 0     | 0     | 5             | 1     | $-\frac{13}{14}$ | $\frac{1}{2}$  |
| 3  | 1     | 0     | $\frac{1}{2}$ | 0     | $\frac{5}{28}$   | $\frac{3}{20}$ |
| 7  | 0     | 1     | $\frac{3}{2}$ | 0     | $-\frac{13}{14}$ | $\frac{1}{2}$  |
| 16 | 0     | 0     | 0             | 0     | $\frac{15}{14}$  | $\frac{1}{2}$  |

And so another optimal solution is  $x_1 = 3$ ,  $x_2 = 7$ , and  $x_3 = 21$ .

We then write all optimal solutions in the form:

$$\left\{ (1-t) \left( \frac{9}{10}, \frac{7}{10}, \frac{21}{5} \right) + t(3, 7, 0) \text{ for all } t \in [0, 1] \right\}$$

**Solution 3 (continuing from p. 4)** (c) Fixing  $x_3 = 1$  corresponds to setting  $t = 16/21$ , this gives:

$$\begin{aligned} x_1, x_2, x_3 &= \left(1 - \frac{16}{21}\right) \left(\frac{9}{10}, \frac{7}{10}, \frac{21}{5}\right) + \frac{16}{21}(3, 7, 0) \\ x_1, x_2, x_3 &= \frac{5}{21} \left(\frac{9}{10}, \frac{7}{10}, \frac{21}{5}\right) + \frac{16}{21}(3, 7, 0) \\ &= \left(\frac{45}{210}, \frac{35}{210}, 1\right) + \left(\frac{48}{21}, \frac{112}{21}, 0\right) \\ &= \left(\frac{525}{210}, \frac{1155}{210}, 1\right) \\ &= \left(\frac{5}{2}, \frac{11}{2}, 1\right) \end{aligned}$$

And so the optimal solution would now be  $x_1 = 5/2$ ,  $x_2 = 11/2$ , and  $x_3 = 1$ .

4. Solve the following linear programming problem using the two-phase method:

Maximise:

$$2x_1 + 3x_2 + 4x_3$$

subject to

$$3x_1 + 2x_2 + x_3 \leq 10$$

$$2x_1 + 3x_2 + 3x_3 \leq 15$$

$$x_1 + x_2 - x_3 \geq 4$$

$$x_1, x_2, x_3 \geq 0$$

**Solution 4** Re-writing the constraints using slack and artificial variables, we get:

$$3x_1 + 2x_2 + x_3 + s_1 = 10$$

$$2x_1 + 3x_2 + 3x_3 + s_2 = 15$$

$$x_1 + x_2 - x_3 - s_3 + a_1 = 4$$

and so the first phase is to minimise  $a_1 - 4 = -x_1 - x_2 + x_3 + s_3$ .

**Solution 4 (continuing from p. 5)** Writing the tableau gives:

|    | $x_1$ | $x_2$ | $x_3$ | $s_1$ | $s_2$ | $s_3$ | $a_1$ |
|----|-------|-------|-------|-------|-------|-------|-------|
| 10 | (3)   | 2     | 1     | 1     | 0     | 0     | 0     |
| 15 | 2     | 3     | 3     | 0     | 1     | 0     | 0     |
| 4  | 1     | 1     | -1    | 0     | 0     | -1    | 1     |
| 0  | -2    | -3    | -4    | 0     | 0     | 0     | 0     |
| -4 | -1    | -1    | 1     | 0     | 0     | 1     | 0     |

Choosing 3 as the pivot, we perform  $\bar{r}_1 = \frac{1}{3}r_1$ ,  $r_2 = r_2 - 2\bar{r}_1$ ,  $r_3 = r_3 - \bar{r}_1$ ,  $r_4 = r_4 + 2\bar{r}_1$ , and  $r_5 = r_5 + \bar{r}_1$ :

|        | $x_1$ | $x_2$     | $x_3$   | $s_1$  | $s_2$ | $s_3$ | $a_1$ |
|--------|-------|-----------|---------|--------|-------|-------|-------|
| $10/3$ | 1     | $2/3$     | $1/3$   | $1/3$  | 0     | 0     | 0     |
| $25/3$ | 0     | $5/3$     | $7/3$   | $-2/3$ | 1     | 0     | 0     |
| $2/3$  | 0     | ( $1/3$ ) | $-4/3$  | $-1/3$ | 0     | -1    | 1     |
| $20/3$ | 0     | $-5/3$    | $-10/3$ | $2/3$  | 0     | 0     | 0     |
| $-2/3$ | 0     | $-1/3$    | $4/3$   | $1/3$  | 0     | 1     | 0     |

Choosing  $1/3$  as the pivot, we perform  $\bar{r}_3 = 3r_3$ ,  $r_1 = r_1 - 2r_3$ ,  $r_2 = r_2 - 5r_3$ ,  $r_4 = r_4 + 5r_3$ , and  $r_5 = r_5 + r_3$ :

|    | $x_1$ | $x_2$ | $x_3$ | $s_1$ | $s_2$ | $s_3$ | $a_1$ |
|----|-------|-------|-------|-------|-------|-------|-------|
| 2  | 1     | 0     | 3     | 1     | 0     | 2     | -2    |
| 5  | 0     | 0     | 9     | 1     | 1     | 5     | -5    |
| 2  | 0     | 1     | -4    | -1    | 0     | -3    | 3     |
| 10 | 0     | 0     | -10   | -1    | 0     | -5    | 5     |
| 0  | 0     | 0     | 0     | 0     | 0     | 0     | 1     |

This ends the first phase. Deleting the appropriate columns and rows gives:

|    | $x_1$ | $x_2$ | $x_3$ | $s_1$ | $s_2$ | $s_3$ |
|----|-------|-------|-------|-------|-------|-------|
| 2  | 1     | 0     | 3     | 1     | 0     | 2     |
| 5  | 0     | 0     | (9)   | 1     | 1     | 5     |
| 2  | 0     | 1     | -4    | -1    | 0     | -3    |
| 10 | 0     | 0     | -10   | -1    | 0     | -5    |

Choosing 9 as the pivot, we perform  $\bar{r}_2 = \frac{1}{9}r_2$ ,  $r_1 = r_1 - 3\bar{r}_2$ ,  $r_3 = r_3 + 4\bar{r}_2$ , and  $r_4 = r_4 + 10\bar{r}_2$ :

|         | $x_1$ | $x_2$ | $x_3$ | $s_1$  | $s_2$  | $s_3$  |
|---------|-------|-------|-------|--------|--------|--------|
| $1/3$   | 1     | 0     | 0     | $2/3$  | $-1/3$ | $1/3$  |
| $5/9$   | 0     | 0     | 1     | $1/9$  | $1/9$  | $5/9$  |
| $38/9$  | 0     | 1     | 0     | $-5/9$ | $4/9$  | $-7/9$ |
| $140/9$ | 0     | 0     | 0     | $1/9$  | $10/9$ | $5/9$  |

And so the optimal solution is  $x_1 = 1/3$ ,  $x_2 = 38/9$ , and  $x_3 = 5/9$ , giving a maximum value of the objective function of  $140/9$ .

5. Cardiff University needs to create its exam timetable. It has a set  $M$  of exams (indexed by  $m$ ) to schedule. For each pair of exams  $i, j$ , it has an indicator  $C_{ij}$  that is set to 1 if the modules cannot be scheduled at the same time (due to sharing students), and 0 if they can be scheduled at the same time. Let  $T$  be the set of time slots available, indexed by  $t$ . Formulate an linear programming problem that finds a feasible schedule using the least time slots.

**You are not asked to solve the linear programming problem!**

**Solution 5** Define  $X_{mt}$  as a binary variable indicating if module  $m \in M$  is scheduled at time  $t \in T$ . Define  $Y_t$  as the binary variable indicating if there is an exam on day  $t \in T$ . Then a possible formulation would be:

Minimise:

$$\sum_{t \in T} Y_t$$

subject to

$$\sum_{t \in T} X_{mt} = 1 \quad \forall m \in M$$

$$|M|Y_t \geq \sum_{m \in M} X_{mt} \quad \forall t \in T$$

$$C_{ij}(X_{it} + X_{jt}) \leq 1 \quad \forall t \in T \quad \forall i, j \in M$$

$$X_{mt}, Y_t \text{ is binary } \forall t \in T \quad \forall m \in M$$
